

Project #1 - Rock Paper Scissors Grading Rubric

	Excellent (4 points)	Good (3 points)	Needs Improvement (2 points)	Incomplete (1 point)
Input Handling	Input is validated correctly; invalid input stops the program with a clear error message.	Input is mostly validated; some edge cases (e.g., extra spaces or mixed case) may cause issues. Error message provided for invalid input.	Basic input validation present but allows some invalid inputs (e.g., unrecognized options or program crashes).	Little or no input validation. Invalid inputs cause the program to crash or produce incorrect behavior.
Computer Move Logic	Computer move is generated correctly and consistently.	Computer move is generated and assigned correctly but with minor inefficiencies or unnecessary code.	Computer move generation or assignment has significant errors but still allows the program to run in most cases.	Computer move generation or assignment is missing or fundamentally incorrect.
Winner Determination	Game logic is implemented correctly. All possible cases (win, lose, tie) are accounted for.	Game logic is mostly correct, with minor errors in win/lose/tie determination.	Game logic is partially correct, but some scenarios produce incorrect outcomes or unexpected errors.	Game logic is missing or severely flawed, resulting in consistently incorrect or no outcomes.
Code Clarity and Comments	Code is well-organized, easy to read, and includes clear, meaningful comments.	Code is organized and mostly clear, with comments for most major parts of the program.	Code is difficult to follow due to poor organization or lack of comments explaining key parts of the program.	Code lacks organization and comments, making it hard to understand or follow.
Functionality and Output	The program runs without errors, includes clear feedback for all user actions (e.g., choices, results).	The program runs without errors and produces correct outputs most of the time but may lack some feedback or clarity in user interactions.	The program runs but has noticeable errors in output, or user feedback is unclear or inconsistent.	The program does not run correctly, produces frequent errors, or lacks meaningful feedback for the user.
